The International Commission on Illumination (CIE) is a **global non-profit** organization dedicated to advancing the **science, technology, and art of light and lighting**, encompassing the full range of related topics including **scientific fundamentals** such as **vision, colour, the metrology** of optical radiation, **photobiology**, and **photochemistry**, as well as lighting applications indoors, outdoors, and in image technology. The CIE provides a forum for diverse **open expert discussion** and information exchange within, between, and beyond these fields.

- Support science, promote discussion and information exchange
- Develop and promote consensus within our scope with publications

- Our 6 Divisions each establish work plans in which technical committees (TCs) form to address a specific question; some may be inter-divisional, and others may be joint with another organization.
- TC proposals are reviewed and approved by the national members in the sponsoring Division(s) and by the CIE leadership.
- TCs must have at least 5 expert members from 5 countries to initiate work.
 - TC Chair accepts members on the basis of having relevant expertise and willingness to contribute.

Open science:

- increases scientific collaborations and sharing of information for the benefits of science and society;
- makes multilingual scientific knowledge openly available, accessible and reusable for everyone; and
- opens the processes of scientific knowledge creation, evaluation and communication to societal actors beyond the traditional scientific community.

Where to find the datasets ? Embedded into CIE Publications

PDF viewer interface showing a technical report cover page. The left sidebar displays a file named "CIE_RefSpectrum_L41.csv" under the heading "Anlagen". The main content area shows the CIE logo, ISBN 978-3-902842-66-4, DOI: 10.25039/TR.251.2023, and the title "TECHNICAL REPORT LED Reference Spectrum for Photometer Calibration". The date "2023-10-11" and "CIE 251:2023" are visible at the bottom.

CIE-metadata: Interpolation

"interpolationMethod": "linear",

Value	Description
"nearest"	Chooses the Y value corresponding to the X value that is nearest to the current xi value
"linear"	Sets the interpolated values to points along the line segments connecting the X and Y data points
"cubic-spline"	Guarantees that the first and second derivatives of the cubic interpolating polynomials are continuous, even at the data points
"cubic-Hermite"	Guarantees that the first derivative of the cubic interpolating polynomials is continuous and sets the derivative at the endpoints to certain values in order to preserve the original shape and monotonicity of the Y data.
"Sprague"	Sprague 5 point interpolation as outlined in CIE 167:2005
"Lagrange"	Lagrange Interpolation
"useRelatedDataset"	In some cases interpolation is not recommended but a dataset with different wavelength range is recommended. Example is the 5 nm spectral data given in CIE 015. For those the 1 nm data should be used as published with CIE 018:2019. The related dataset should be stated in the corresponding relatedIdentifier field.
"useRelatedFormula"	In some cases interpolation is not recommended but an explicitly formula shall be used. Example is the Standard illuminant A. The reference to the formula shall be described in the description of the dataset
" :unal"	unallowed, suppressed intentionally
" :unap"	not applicable, makes no sense
